Procession Quality Control For Sage X3

Quality Management

Quality Management is a critical component of your company's success. Your Quality Management team plays a vital role as the gatekeeper of your company, ensuring quality in every step of your processes, from received raw materials, to the product your company delivers to its customers.

Quality Management requires data capture and analysis. Many companies struggle with audits, parts trending out of specification, or managing quarantined stock. Some companies also use external systems that do not integrate fully with their ERP system. These companies do not experience the power of a truly embedded Quality Management system, which allows QC to control stock flows. The Procession Quality Control Module provides the tools that your company needs to manage, record, and analyze your quality data, all from within your Sage X3 system.

Companies do business with companies that they trust; consistent quality builds trust with your customers. Procession Quality Control Module for Sage X3 provides the tools to improve processes, reduce failures, analyze results, and provide consistent quality products to your customers.

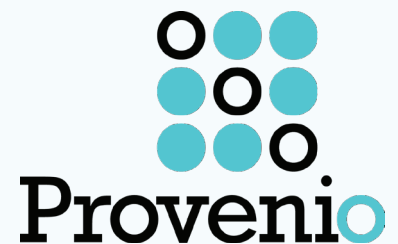

Ease of Use and Maximum Flexibility

Our team of process manufacturing professionals and chemists designed Procession exclusively for Sage X3. The toolset and development mythology used in creating Procession are the same ones used by Sage. Because Procession is part of your Sage X3 system, it shares the Sage X3 interface. This use of a common interface simplifies user training and user adoption of the product.

Included with Procession are many quality management reports. You can easily add additional reports using Crystal Reports® or the native Sage X3 query tools. Procession data is stored in the same database as your Sage X3 data, which simplifies data access and maintenance. Data flows automatically between Sage X3 and Procession, from pre-sales to manufacturing, in an intuitive manner and without the need for integration links.

If your company has unique needs, Procession is highly customizable. This is possible because Procession shares the Sage X3 customization engine, which allow screens and reports to be easily customized on either screens or with source code.

Ease of use, maximum flexibility and its complete functionality are reasons why Procession is THE Quality Management solution for Sage X3.

Superior Functionality

From the ground-up, ProceSSION Quality Control, along with native Sage X3 functionality, provides the quality management functionality that you need. Users can define product or customer specifications; you can setup products to quarantine automatically upon receipt, based upon transaction type. You can track and automatically quarantine lot expiration dates when a lot nears its end of shelf-life. Users can pull multiple samples from a batch and record the results as well as analyze and archive those test results. ProceSSION Quality Control can also automatically email Certificates of Analysis to customers.

ProceSSION Quality Control Features Include:

- Product Specifications
- Customers Specifications
- Sales Specifications
- Ability to track results from multiple samples
- Create Signoffs and Production Instructions on batch tickets (requires ProceSSION Manufacturing/Distribution module)
- One-click printing of all certificates of analysis (CofA's) for a delivery
- Print Customer SKUs and product descriptions on CofA
- Analysis tools
- CofA History
- Customizable screens and reports
- Mobile Access
- Query tools – Searchable results
